A deep dive into the Git ~~internals~~ Object Database

Christoph Häfner
@chr1shaefn3r

Quick Topic Clarification

We **are** going to talk about:

- Git Plumbing
- .git/objects/ (the object database)
- .git/refs/

We **are NOT** going to talk about:

- Basics
- Merge strategies
- git:// Protokoll

Quick Topic Clarification

We **are** going to talk about:

- Git Plumbing
- .git/objects/ (the object database)
- .git/refs/

We **are NOT** going to talk about:

- ~~Basics~~
- Merge strategies
- git:// Protokoll

Plumbing vs. Porcelaine

hash-object
cat-file
ls-tree
mktree
commit-tree
fsck
gc
index-pack
ls-files
mktag
pack-objects
repack
verify-pack

commit
push
pull
merge
branch
checkout
clone
bisect
tag
diff

Core Principle

aka. Content-addressable storage

Git Object

Format:

`<type>_<size>\0<value>`

Four Types of Git Objects

blob

filecontent

tree

<mode>_<filename>\0bin(<sha1>)

commit

tree_<sha1>\n

parent_<sha1>\n*

author_<name>_<timestamp+zeitzone>\n

committer_<name>_<timestamp+zeitzone>\n\n

<commit message>

tag

object_<sha1>\n

type_<type>\n

tag_<name>\n

tagger_<name>_<timestamp+zeitzone>\n\n

<tag message>

**But whait, where does Git save the
Diffs?!?!**
